

## Mission & Vission

India has already established itself as the software hub of the world due to the large number of engineers that it produces. There is now an increasing and persistent demand of having engineers who can develop and design. Design thinking is now increasingly being used to create innovative solutions. Within design as a discipline, human-centered design emphasizes the involvement of human perspective in all steps of problem-solving. The human-centered design process leverages technology and enables the development of new technological solutions to address people's needs along with issues of sustainability.
